## WHAT IS CLAIMED IS:

| 1  | 1. A device for ablating tissue, comprising:  |
|--|---|
| 2  | an ablating device having at least one ablating element and a bottom surface,               |
| 3  | the bottom surface being positioned adjacent to tissue to be ablated; and                   |
| 4  | a cover extending over the bottom surface;  |
| 5  | a cavity defined by a space between the cover and bottom surface; and                       |
| 6  | a flowable material positioned in the cavity;   |
| 7  | wherein the cover is movable relative to the ablating device to a position                  |
| <b>***</b> 8                             | which exposes the bottom surface while leaving the flowable material positioned between the |
| 88 99 11 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 | ablating device and the tissue to be ablated.   |
| 13 1<br>1                                | 2. The device of claim 1, wherein:  |
| 2  | the ablating device has a removable tip.  |
| # 1                                      | 3. The device of claim 1, wherein:  |
| <b>E</b> 2                               | the flowable material has a boiling temperature of at least 100 degrees C and a             |
|  | vapor pressure higher than water.   |
| 1  | 4. The device of claim 1, wherein:  |
| 2  | the flowable material is selected from the group consisting of PEG and                      |
| 3  | glycerine.  |
| 1  | 5. The device of claim 1, wherein:  |
| 2  | the ablating device has a plurality of ablating elements.                                   |
| 1  | 6. The device of claim 1, wherein:  |
| 2  | the ablating device forms a closed loop.  |
| 1  | 7. The device of claim 1, wherein:  |
| 2  | the cover is a sleeve which surrounds the ablating device.                                  |
| . 1                                      | 8. A method of ablating tissue, comprising the steps of:                                    |
| 2  | providing an ablating device and a cover, the ablating device having a bottom               |
| 3  | surface, the cover being spaced apart from the bottom surface to define a fluid cavity, the |
| 4  | fluid cavity containing a fluid;  |

| 5          | positioning the cover against a tissue surface,   |  |  |  |
|------------|---|--|--|--|
| 6          | moving the cover away from the bottom surface so that the bottom surface is   |  |  |  |
| 7          | exposed and positioned adjacent the tissue surface, the flowable material conforming to the shape of the tissue surface and being positioned between the bottom surface of the ablating |  |  |  |
| 8          |   |  |  |  |
| 9          | device and the tissue surface; and  |  |  |  |
| 10         | ablating the tissue after the moving step.  |  |  |  |
| 1          | 9. The method of claim 8, wherein:  |  |  |  |
| 2          | the positioning step is carried out with the tissue surface being an epicardial   |  |  |  |
| 3          | surface.  |  |  |  |
| <b>1</b>   | 10. The method of claim 8, wherein:   |  |  |  |
|            | the moving step is carried out by moving the cover while substantially  |  |  |  |
| <u> </u>   | maintaining the position of the ablating device.  |  |  |  |
| <u> </u>   | 11. The method of claim 8, wherein:   |  |  |  |
| 2          | the providing step is carried out with the cover having a removable tip.  |  |  |  |
|            | 12. The method of claim 8, wherein:   |  |  |  |
| <b>1</b> 2 | the providing step is carried out with the flowable material having a boiling   |  |  |  |
| 3          | temperature of at least 120 degrees C.  |  |  |  |
| 1          | 13. The method of claim 8, wherein:   |  |  |  |
| 2          | the providing step is carried out with the flowable material being selected from  |  |  |  |
| 3          | the group consisting of PEG and glycerine.  |  |  |  |
| 1          | 14. The method of claim 8, wherein:   |  |  |  |
| 2          | the providing step is carried out with the ablating device having a plurality of  |  |  |  |
| 3          | ablating elements.  |  |  |  |
| 1          | 15. The method of claim 8, wherein:   |  |  |  |
| 2          | the providing and moving steps are carried out with the ablating device   |  |  |  |
| 3          | forming a closed loop.  |  |  |  |
| 1          | 16. The method of claim 15, wherein:  |  |  |  |

| 2   | •               | me pro  | oviding and moving steps are carried out with the abrating device         |
|---|-----------------|---------|---|
| 3   | forming a clos  | ed loop | around the pulmonary veins; and   |
| 4   |                 | the ab  | lating step is carried out to form an ablation around the pulmonary veins |
| 1   |                 | 17.     | A device for ablating tissue, comprising:                                 |
| 2   |                 | a body  | having a first part and a second part which are coupled together to form  |
| 3   | a closed loop a | and sep | arated to open the closed loop;   |
| 4   | •               | at leas | t one ablating element mounted to the body; and                           |
| 5   | ·               | a flexi | ble tip extending from an end of the body, the tip extending for at least |
| 6   | two inches and  | d being | free of any ablating elements, the flexible tip facilitating advancement  |
| 7<br>7<br>1   | of the body the | rough a | space between the epicardium and pericardium.                             |
| 1   |                 | 18.     | The device of claim 17, wherein:  |
|   |                 | the tip | is removable from the body.   |
| i 1   |                 | 19.     | The device of claim 17, wherein:  |
| of the last wall will be start to the start of the start |                 | the bo  | dy has a plurality of ablating elements attached thereto.                 |
| 1   |                 | 20.     | The device of claim 17, wherein:  |
| 2   |                 | the ab  | lating device has an ultrasonic transducer.                               |
| 1   |                 | 21.     | The device of claim 17, wherein:  |
| 2   |                 | the bo  | dy has a convex bottom surface which is positioned adjacent the tissue    |
| 3   | to be ablated.  |         |   |
| 1   |                 | 22.     | The device of claim 21, wherein:  |
| 2   |                 | a men   | nbrane forms the convex surface.  |
| 1   |                 | 23.     | The device of claim 22, wherein:  |
| 2   |                 | the m   | embrane partially defines a cavity containing a fluid.                    |
| 1   |                 | 24.     | The device of claim 17, wherein:  |
| 2   |                 | the ab  | plating device has a plurality of ablating elements.                      |
| 1   |                 | 25.     | The device of claim 17, wherein:  |
| 2   |                 | the ab  | plating device forms a closed loop around the heart.                      |

| Ţ                     | 20. A system of forming an ablation from an epicardial location,                 |
|-----------------------|--|
| 2                     | comprising the steps of:   |
| 3                     | a liquid delivery device for delivering a liquid to a space between the          |
| 4                     | pericardium and epicardium to create a liquid environment around the heart; and  |
| 5                     | at least one ablating element for ablating tissue when submerged in the liquid   |
| 6                     | environment around the heart.  |
| 1                     | 27. The system of claim 26, wherein:   |
| _ 2                   | the ablating element is an element selected from the group consisting of RF,     |
| 2<br>3<br>1<br>1<br>2 | ultrasound, microwave, cryo and laser  |
| <u> </u>              | 28. The system of claim 26, wherein:   |
| <u> </u>              | the liquid delivery device is delivered through a penetration in the             |
| <b>I</b> 3            | pericardium.   |
| 1 1 2 2 3             | 29. A method of ablating tissue from an epicardial location, comprising the      |
| 2                     | steps of:  |
| <b>1</b> 3            | providing an ablating device having a tip;                                       |
| 4                     | advancing the ablating device through a space between the epicardium and         |
| 5                     | pericardium;   |
| 6                     | removing the tip of the ablating device; and                                     |
| 7                     | ablating tissue with the ablating device.  |
| 1                     | 30. The method of claim 29, further comprising the step of:                      |
| 2                     | forming a closed loop with the ablating device after the removing step.          |
| 1                     | 31. The method of claim 29, wherein:   |
| 2                     | the advancing step is carried out with the ablating device having a plurality of |
| . 3                   | ablating elements.   |
| 1                     | 32. The method of claim 29, wherein:   |
| 2                     | ablating step is carried out to form an ablation around the pulmonary veins.     |
| 1                     | 33. The method of claim 29, wherein:   |

| 2          |                | the pr   | oviding step is carried out with the tip having a length of at least two   |
|------------|----------------|----------|--|
| 3          | inches and be  | ing free | e of ablating elements.  |
| 1          |                | 34.      | The method of claim 33, wherein:   |
| 2          |                | the pr   | oviding step is carried out with the tip having a length of at least four  |
| 3          | inches.        |          |  |
| 1          |                | 35.      | A method of forming an ablation from an epicardial location,   |
| 2          | comprising th  | e steps  | of:  |
| <u>-</u> 3 |                | creati   | ng a liquid environment around a patient's heart;  |
| <u></u> 4  |                | positi   | oning an ablating device against an epicardial location of the patient's   |
| <b>5</b>   | heart; and     |          |  |
| <u> </u>   |                | ablati   | ng tissue from the epicardial location while the ablating device is  |
| 5 6 7      | contained wit  | hin the  | liquid environment.  |
| æ.         |                |          |  |
|            |                | 36.      | The method of claim 35, wherein:   |
| <u> </u>   |                | the cr   | reating step is carried out by at least partially filling the pericardial space  |
| 1 2 2      | with the liqui | d to cre | eate the liquid environment around the patient's heart.  |
| 1          |                | 37.      | The method of claim 35, wherein:   |
| 2          |                | the al   | olating step is carried out with the ablating device being submerged   |
| . 3        | within the liq | uid.     |  |
| 1          |                | 38.      | The method of claim 35, wherein:   |
| 2          |                | the ci   | reating step is carried out with the liquid environment being contained by   |
| 3          | the pericardit |          |  |
| 1          |                | 39.      | The method of claim 35, wherein:   |
| 2          |                |          | blating step is carried out with the ablating device having an ablating  |
| 3          | element which  |          | RF, ultrasound, laser, cold or microwave.  |
| . 1        |                | 40.      | The method of claim 35, wherein:   |
|            |                |          |  |
| 2          | opening, the   |          | reating step is carried out with the pericardium being incised to create an avironment having an exposed free surface of the liquid. |
|            | , U            |          | •  |
| T          |                | 41.      | The method of claim 35, wherein:   |

| 2   | the creating step is carried out with the ablating device passing through a      |
|-----|--|
| 3   | penetration in the pericardium.  |
| 1   | 42. A method of ablating tissue, comprising the steps of:                        |
| 2   | providing an ablating device having a convex contact surface;                    |
| 3   | positioning the convex contact surface adjacent to an epicardial surface;        |
| 4   | ablating the epicardial tissue after the positioning step.                       |
| 1   | 43. The method of claim 42, wherein:   |
| 2   | the providing step is carried out with the ablating device comprising an         |
| 3   | ultrasonic transducer.   |
| 1   | 44. The method of claim 43, wherein:   |
| 2   | the providing step is carried out with the convex surface being formed by an     |
| 3   | element mounted to the ultrasonic transducer.                                    |
| 1   | 45. The method of claim 44, wherein:   |
| 2   | the providing step is carried out with a membrane forming the convex surface.    |
| 1   | 46. The method of claim 45, wherein:   |
| 2   | the providing step is carried out with the membrane partially defining a cavity  |
| 3   | containing a fluid.  |
| 1   | 47. The method of claim 42, wherein:   |
| 2   | the providing step is carried out with the ablating device having a plurality of |
| 3   | ablating elements.   |
| 1   | 48. The method of claim 42, wherein:   |
| . 2 | the providing and moving steps are carried out with the ablating device          |
| 3   | forming a closed loop around the heart.  |
| 1   | 49. The method of claim 48, wherein:   |
| 2   | the providing and moving steps are carried out with the ablating device          |
| 3   | forming a closed loop around the pulmonary veins; and                            |
| 4   | the ablating step is carried out to form an ablation around the pulmonary veins  |
| 1   | 50. An ablating device for ablating tissue, comprising:                          |

| 2  |                 | a body;   |
|--|-----------------|---|
| 3  |                 | an ablating element coupled to the body;  |
| 4  |                 | a membrane extending over at least part of the ablating element, the membrane   |
| 5  | being spaced a  | apart from the ablating element to form a fluid cavity; and                     |
| 6  |                 | the fluid cavity containing a fluid.  |
| 1  |                 | 51. The ablating device of claim 50, further comprising:                        |
| 2  |                 | a fluid source coupled to the fluid inlet for circulating the fluid through the |
| 3 .  | fluid cavity.   |   |
| 46<br>24 44<br>34 45 45<br>34 47 47 47 47 47 47 47 47 47 47 47 47 47 | •               |   |
| 1  |                 | 52. The ablating device of claim 51, further comprising:                        |
| <b>1</b> 2   |                 | a heat exchanger having an inlet which receives the fluid and an outlet which   |
| 3  | returns the flu | aid to the fluid cavity.  |
| 1 2 2 3 3 T 1  |                 | 53. The ablating device of claim 50, wherein:                                   |
| <u> </u>   |                 | the membrane forms a convex contact surface.                                    |
| 1 2  |                 |   |
| 1  |                 | 54. The ablating device of claim 50, wherein:                                   |
| <b>2</b>   |                 | the membrane forms the convex contact surface with fluid pressure.              |
| 1  |                 | 55. The ablating device of claim 50, wherein:                                   |
| 2  |                 | the membrane permits some of the fluid to pass therethrough to wet the target   |
| 3  | tissue with th  | e fluid.  |
| 1  |                 | 56. The ablating device of claim 50, wherein:                                   |
| 2  |                 | the membrane extends over more than one ablating element.                       |
|  |                 |   |
| 1  |                 | 57. An ablating device for ablating tissue, comprising:                         |
| 2  |                 | a body;   |
| 3  |                 | an ablating element coupled to the body;  |
| 4  |                 | a flexible skirt surrounding at least a portion of the ablating element;        |
| 5  |                 | the fluid cavity containing a fluid.  |
| 1  |                 | 58. The ablating device of claim 57, further comprising:                        |
| 2  |                 | a fluid delivery channel which delivers fluid to the fluid cavity.              |
| 1  |                 | 59. The ablating device of claim 57, wherein:                                   |

- the body has a contact surface on a bottom side, the contact surface being
- 3 convex.
- 1 60. A method of ablating tissue from an epicardial location using a device
- 2 according to claims 51-59.
